

BIKE DEKHO | CUSTOMER ANALYTICS

Who Actually Buys the Bike? A Data Story of 1,000 Customers

A deep dive into Bike Dekho's customer database, uncovering the demographic, lifestyle, and economic patterns that separate buyers from browsers — and what the business should do about it.

The Setup

Bike Dekho sits on a database of 1,000 prospective customers — their income, family life, commute, job, and whether they ultimately bought a bike. Taken alone, each record is just a row. Taken together, they tell a story: not everyone who *can* afford a bike buys one, and not every buyer looks like you'd expect. This report follows the data to find out who Bike Dekho's real customer is, and where the next 500 sales are hiding.

48.1%

OVERALL PURCHASE RATE

58.9%

BEST REGION — PACIFIC

61.1%

ZERO-CAR HOUSEHOLDS

54.1%

SINGLE CUSTOMERS

The headline: Almost exactly one in two people in the database bought a bike — a coin-flip on the surface. But that 48.1% average hides enormous swings underneath: purchase rates range from 22% among customers with five children to 67% among the very youngest shoppers. The average is the least interesting number in this dataset.

Geography Sets the Baseline

The first fork in the story is **where** a customer lives. North America is Bike Dekho's biggest market by volume — 508 of the 1,000 customers — but it converts the worst. The Pacific region is the opposite: fewer prospects, but by far the warmest audience.

Region	Prospects	Buyers	Rate
Pacific	192	113	58.9%
Europe	300	148	49.3%
North America	508	220	43.3%

North America carries more than half of all prospects in the file, so even a modest lift in its conversion rate would outweigh gains almost anywhere else.

Marital status widens this gap further. Singles out-convert married customers almost everywhere, but the effect is strongest in North America — married North American customers convert at just 36%, the single worst segment on the map, while single customers in the Pacific region hit nearly 64%.

Why this matters: A generic, one-size-fits-all pitch is working against Bike Dekho in North America. The messaging that wins in the Pacific — likely built around independence, fitness, or lifestyle — is not landing with married North American households, who may be weighing the bike against family-oriented spending instead.

Life Stage: Younger, Freer, More Likely to Buy

Age tells a strikingly consistent story: purchase interest **peaks in the mid-thirties to mid-forties** and steadily erodes from there. By retirement age, interest has fallen to a third of the 36-45 peak.

Family size reinforces the same pattern. Customers with one child convert best (57%); each additional child after that chips away at the purchase rate, bottoming out at just 22% for households with five children — the single lowest-converting group in the entire dataset. Car ownership follows the identical logic: households with **zero or one car** convert above 56%, while two, three, and four-car households fall to roughly a third.

Reading the pattern: These three signals — young-to-mid-life age, fewer children, fewer cars — describe the same customer from different angles: someone whose life isn't yet optimized around a car-based, multi-child routine, and who has room in their commute and calendar for a bike. Commute distance confirms it directly: customers living within 5 miles convert far better than those commuting 10+ miles, where a bike is a much harder daily substitute for a car.

Money and Work: It's Not Just About Income

Intuition says higher income should mean more purchases. The data disagrees. The **30-50K income band converts best (56.7%)**, and purchase rate actually declines as income climbs into the highest bracket. The lowest earners ($\leq 30K$) are the most resistant group, but the richest customers aren't far ahead of them either.

The car-ownership twist: High earners in this dataset overwhelmingly own more cars (3-4 car households average \$92K-\$108K income) — and as shown in Chapter 3, more cars means a lower likelihood of buying a bike. Income isn't suppressing demand directly; it's correlated with a car-centric lifestyle that competes with the bike for the same commute.

Education and occupation echo the same "middle beats extremes" theme. Bachelor's and Graduate degree holders convert best; Professionals and Clerical workers out-convert Management and Skilled Manual roles.

Meet the Buyer — and the Customer Bike Dekho Is Losing

Putting every thread together produces two clear personas at opposite ends of the funnel.

● The High-Converting Prospect — "The Independent Professional"

Single or newly settled, aged 36-45, living in the Pacific region, earning a moderate 30-50K, holding a Bachelor's degree, working a Professional or Clerical role, owning 0-1 cars, and commuting under 5 miles. Segments matching this profile convert at **60-75%**, roughly 20-30 points above the dataset average.

● The Cold Prospect — "The Settled Commuter"

Married with 4-5 children, aged 56+, based in North America, owning 3-4 cars, earning top-bracket income, commuting 10+ miles, and holding only a partial high-school education. These segments convert at **22-30%**, roughly half the dataset average.

The gap between these two personas — roughly 40 to 50 percentage points — is the single most important number in this report. It means Bike Dekho's marketing spend delivers wildly different returns depending on who it reaches, even at identical cost per contact.

What Bike Dekho Should Do Next

Four moves follow directly from the data:

1. **Re-target North America with life-stage-specific messaging.** It's the largest market (508 prospects) but the weakest converter (43.3%). A segmented campaign — independence and commute-savings for singles, family-budget and second-vehicle framing for married households — could close a meaningful share of the 8-16 point gap versus Europe and the Pacific.
2. **Prioritize short-commute, low-car-ownership households** in prospecting lists and lookalike audiences. These customers need the least behavior change to say yes, and they already convert above 55%.
3. **Don't over-index on high income as a targeting proxy.** The 30-50K band out-converts every income bracket above it. Budget-tier and mid-tier bike models, priced and marketed toward this segment, are likely to outperform a premium-only push.
4. **Build a "life stage" filter into acquisition targeting** — young-to-mid-life, fewer children, fewer cars — rather than relying on income or occupation alone, both of which show weaker and less consistent relationships with purchase behavior.

Bottom line: Bike Dekho doesn't have a demand problem — it has a targeting problem. The customers most likely to buy are identifiable well before a sales conversation even starts. Shifting acquisition spend toward the Independent Professional profile, and away from the Settled Commuter profile, is the fastest lever available to lift the 48.1% baseline conversion rate.
